

io font download

Instagram Font Generator.

The Font Generator is a tool to pick, preview, copy and paste fancy text to use on Instagram and other social networks. With this text tool, you can edit and experiment with your content then preview how your profile bio will look on Instagram and Twitter!

Copy and Paste Fonts.

Using this generator, you can edit your text and preview different font styles for Instagram. While social networks limit your styling options in profiles, posts, and comments, you can use this tool to create fancy text or pick cool fonts.

If you've ever seen profiles with cursive text or bold fonts and wondered how that's possible, it's a secret little trick using something called Unicode. While you're not actually copying a font, Unicode allows us to create pseudo-fonts made up of special characters that look similar to our regular alphabet.

Wait, but why can't I just copy fonts from my computer ? Social networks don't allow you to add styling to your text, so instead we "hack" Unicode to build a special dictionary which replaces each letter—it's really a font changer and not actually a generator.

How does it work.

With the increasing visual nature of the web, the Font Generator is unique in that it provides a visual preview as you edit your text and experiment with different fonts.

Text - Start by editing the text input at the top of the page. Don't worry about this being perfect yet, just type something new to get started. **Fonts** - As you type, you'll notice the fonts live update . Scroll through all the fonts to see the different options available. **Preview** - Click on a font example to see it in the visual preview area. **Copy** - Once you're happy with your text, font, and preview, click the "Copy" button and paste it wherever you need it!

If you want to use more than one font style, you can copy just the words you need and paste them elsewhere, then come back to the Font Generator to create more words as you need. ρℓαγ Hƒ V E FL R !

Cool Text Generator for Modern Age.

Sometimes we just need a decent stylish text in 10 minutes, Maybe a the next project's logo. We don't have Photoshop, we don't have good design in mind. What if there is a web service for us to browse-and-pick a nice effect, then we just customize → download → use it? And yes, maketext.io is born for this purpose.

Maketext.io is the modern cool text generator that empowers SVG filters and 800+ open-font-licensed web fonts. While there are already numerous similar websites around, we handcrafted maketext.io with following guideline in mind:

Make It Quick, Make It Simple On the Web, on the Fly Easily Customizable Vector Based with Raster Support.

Technical Consideration.

For every fancy text effect, we provide both SVG and PNG format for you to download. Since SVG is well-prepared for everyone to use in HTML5 era, you will still want to know about its limitation so you can choose which one to use between SVG and PNG more wisely.

Browser Compatibility.

Just like there are some CSS attributes that are not well-supported by all modern browsers, there might be difference between implementations of browsers to the SVG filter we use, specially of the old browsers like Internet Explorer.

Generally speaking modern browsers like latest versions Chrome, Firefox and Safari should be able to render them correctly, but you should check if you need to support browsers like IE9. For a detail list of browser support for SVG filter, check Can I Use "SVG filter" for more information.

Rendering Performance.

Rendering SVG can be more CPU-intensive than rendering raster images like PNG or JPG. This is especially true when using complicated SVG filters, and almost all filters here are complicated. Consider using CSS property "will-change" to prevent redundant re-rendering when you use those downloaded SVG files, just like we've done in our stylish text gallery.

Image Quality.

While SVG is scalable-vector-based and should be responsive-ready, sometimes there are still unwanted aliasing/jagged edges or not-aligned shapes, due to number rounding / precision issues when rendering. If you use those SVG files with dynamic sizing, remember to check it's visual appearance in different resolution before shipping your works.

Embedded Font.

To make custom web font works in SVG files, we actually convert every letter from text into SVG path instead of embedding the whole font file

inside it. This can make the file smaller (if the text is short), but then it won't be able to change the text after generation of the SVG file, and the SVG file can't be indexed by search engine through its content. You can still use the alt attribute in img tag for SEO though.

Copyable Cool Text.

While cool text in images are great, sometimes we need to use them in text posts or even messengers. Check out our Fancy Text Generator, which is dedicated for this purpose: generate stylish text that are copyable!

Resources.

While making stylish text with maketext.io, you may also want to build your own cool text filter. This article "The Art Of SVG Filters And Why It Is Awesome" provides a comprehensive guide with a lot of example for anyone who want to build a cool text SVG filter from scratch, a definitely must-read.

Additionally, these filters can actually be used in any shapes, not only for text. For an inspiring example of SVG beyond merely shapes, this talk and slide about "SVGs beyond mere shapes" is the thing you will never want to miss.

The fact that these cool text effects are built with SVG filters makes it possible to couple with other css or javascript libraries. For example, you can use loading.css or transition.css to animate your stylish text. Check loading.io animated text generator for inspiration of how loading.css can be used in text animation.

Contact.

We want to build this service to its best, but there are always bugs or glitches. Feel free to contact us via by mail, or leave your words in the Disqus widget below. We always appreciate your feedback and support, by which we could make this service better together.
